Plutas - Product & Decision Experience Observations

(This case study is based on a proposal / product observation and does not disclose confidential data.)

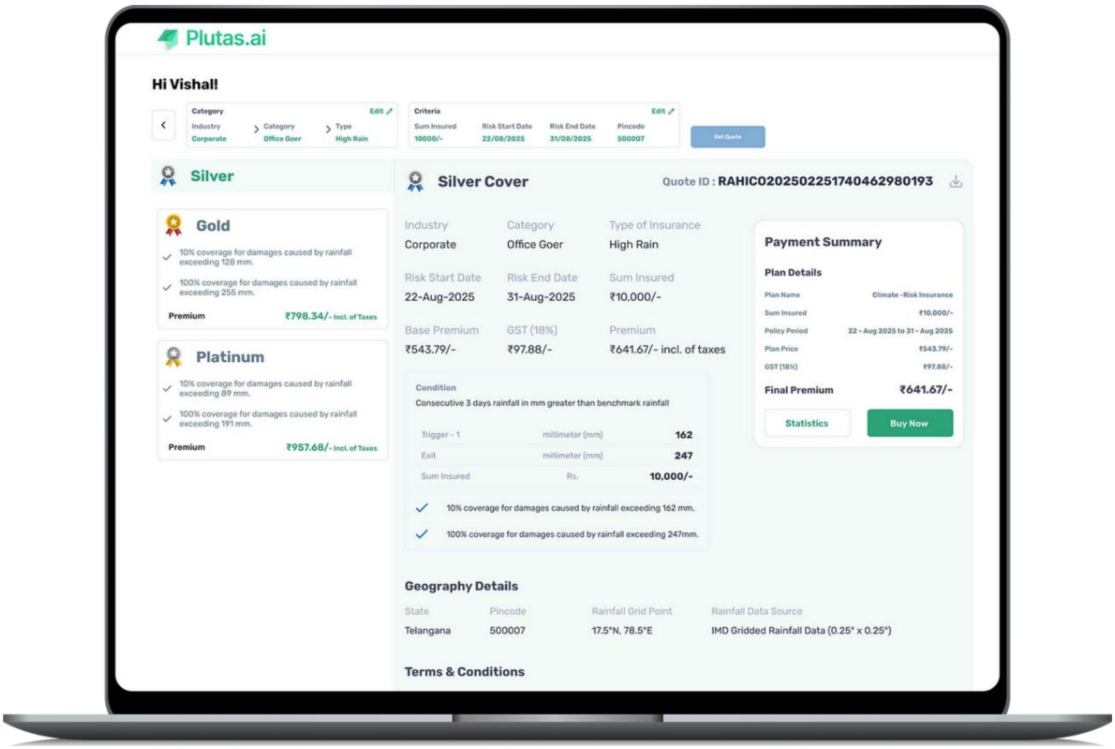
What Plutas Is Doing Well & Where the Real Opportunity Is --

Plutas has strong AI and climate risk intelligence.
The main challenge isn't what the system can do, but how clearly that intelligence is translated into something business users can understand and act on.

What Plutas Is Doing Well

Plutas.ai = AI-driven climate risk intelligence for insurers, lenders & enterprises

- Strong **AI + climate risk modelling**
- Technically credible, actuarially sound platform
- Well-suited for **regulated, high-stake decision environments**
- Quote, pricing, triggers, thresholds, geography, and data sources are clearly computed and reliable



(Current experience demonstrates strong data & pricing logic, but expects users to interpret rather than decide.)

Core Challenge (Visible in the Current Experience)

*While the system is powerful, **its value is hidden inside complexity**.*

Today, the experience feels:

- **Data-heavy**
- **Analyst-oriented**
- **Dependent on user interpretation**

For example, on the **quote screen**:

- Users see ***rainfall triggers, exit thresholds, coverage percentages, premiums, and grids***
- But the system does **NOT** clearly answer:
    - ***Which plan is best for me?***
    - ***What am I risking if I choose Silver vs Gold vs Platinum?***
    - ***What decision should I confidently take right now?***

The user is asked to **analyse**, not **decide**.

The Real Opportunity

*Turning complex climate + AI signals **into clear, confident business decisions***

What business users actually want to know:

- **Should we insure this asset?**
- **Is this loan safe over the policy period?**
- **Which level of risk exposure should we act on now?**

Winning here is not about better AI — it's about decision clarity.

Where I Add Direct Value (Without Building a Large Team)

*My contribution sits at the intersection of **Product, UX, and Business Narrative** — translating intelligence into action.*

1. Reframe Features Into Outcomes

From

- Risk scores
- Rainfall thresholds
- Coverage percentages
- Technical policy conditions

To

- *Approve / Reject / Mitigate / Monitor*
- *Basic protection vs full business continuity*
- *Low confidence vs high confidence decisions*

The goal is to make the value **visible in seconds, not slides** — especially on key screens like plan comparison and checkout.

2. Design Experiences That Surface Decisions, Not Data

Applied directly to the current quote screen:

- Progressive disclosure instead of showing everything at once
- Clear **risk confidence indicators**
- A visible **system recommendation** with reasoning
- “What should I do next?” built directly into the UX

This shifts the experience from *reading numbers* to *taking action*.

---

3. Create Role-Based Narratives

Different users decide differently — the UX and messaging should reflect that:

- **Insurers** → underwriting confidence & loss predictability
- **Lenders** → portfolio risk, long-term exposure & compliance
- **Enterprises** → asset protection & operational continuity

The same AI, explained through **different decision lenses**.

Execution Reality

- Can be driven initially by **one senior product/UX leader**
- No large team required upfront
- Team scales **after clarity, adoption, and traction are proven**

Why This Matters?

*This is a **leverage** role:*

- Small, focused input
- High impact on adoption, trust, and conversion
- Direct alignment with Plutas' business goals

*Plutas already has the intelligence — **this role unlocks its business value**.*
