

Admin Profile Page - UX Report

Table of Contents:

- 1. [Overview](#)
- 2. [Major Findings](#)
- 3. [Risk & Governance Observations](#)
- 4. [UX Maturity Assessment](#)
- 5. [Current Workflow \(Observed\)](#)
- 6. [Workflow Challenges](#)
- 7. [Recommended Workflow \(UX Optimized\)](#)
- 8. [Final Summary](#)

1. Page Structure Overview

Four horizontal tabs: Personal Info, Business Details, Tax & Legal, Security.
Logical separation is well structured and reduces vertical clutter.

2. Major Strategic Findings

- All fields are editable, including **Username (high-risk design decision)**.

The screenshot shows the Admin Profile Page with four horizontal tabs: Personal Info, Business Details, Tax & Legal, and Security. The Personal Info tab is active, displaying three fields: Full Name (Maresh Diagnepein), Username (empty), and Email Address (paramedicaldiagnopein@gmail.com). The Email Address field is marked as Read-only.

- Email is read-only (positive control decision).
- Phone field accepts invalid characters (**no input validation** present).

The screenshot shows the Phone Number field with the text "9900%%*nshh@!\$67^". The field is marked as Read-only.

- Form architecture uses card-per-field pattern, increasing visual fragmentation.

The screenshot shows the 'Business Details' tab in the Admin Profile page. The form is structured as a grid of cards, each representing a single field. The fields are: BUSINESS NAME (with value 'Diagnopin'), OWNER NAME, LEGAL NAME, BUSINESS TYPE, BUSINESS PHONE, BUSINESS EMAIL, WEBSITE URL, and BUSINESS ADDRESS. Each card displays 'Not provided' and an edit icon, indicating that all fields are editable. The layout is fragmented due to the card-per-field pattern.

- Security tab limited to password change only (basic security maturity).

3. Risk & Governance Observations

- Editable username may impact identity integrity and system consistency.
- Lack of phone validation introduces data integrity risk.
- Tax/legal fields likely require stronger format validation (GST/PAN).
- Security controls appear minimal for an admin-level system.

4. UX Maturity Assessment

- Information Architecture: Strong (clear tab separation).
- Form Structure: Moderate (over-fragmented layout).
- Data Validation: Weak (missing input constraints).
- Security Layer: Basic (password-only security).

Estimated UX Score (Admin Profile Page): 3.2 – 3.6 / 5

5. Current Workflow (Observed)

1. User opens Admin Profile page and selects a tab (Personal / Business / Tax & Legal / Security).
2. User edits fields directly (all fields editable).
3. User expects validation and guidance (format, required fields), but phone input accepts invalid characters.

4. User proceeds to next tab and repeats edits; risk of inconsistent or accidental changes increases (e.g., Username).
5. In Security tab, user can only change password; no broader account/security controls are available.

6. Workflow Challenges

- No clear guardrails for identity fields (Username editable).
- Weak data-quality gates (missing input constraints/format validation).
- Card-per-field layout can slow scanning and editing when multiple fields must be updated.
- Security workflow limited to password change; missing session/device controls reduces admin confidence.

7. Recommended Workflow (UX Optimized)

1. Tab entry shows section summary + clear edit mode (Edit / Save / Cancel) at section level.
2. Identity-critical fields (Username) are locked or change-controlled (verification/approval) with clear consequences.
3. Strong field validation (phone masking, allowed characters, GST/PAN format) with inline error messages.
4. Progress feedback on save(success message, last-updated timestamp).
5. Security tab expands to include 2FA, active sessions, last login, and logout-all for admin-grade control.

8. Final Summary

The Admin Profile page demonstrates good structural organization but **requires stronger validation logic, governance controls, and enhanced security layers** to reach enterprise-grade maturity. Improvements should prioritize input validation, identity integrity safeguards, and enhanced security mechanisms.
