 5. [UX Maturity Evaluation](#)
-

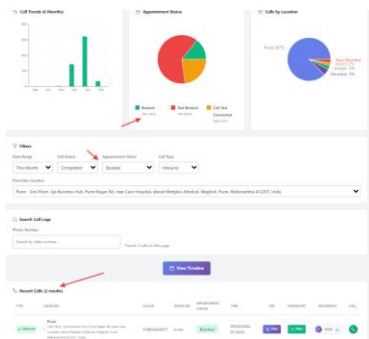

1. Screen Overview

Screen Purpose: View and analyze calls across all franchises.

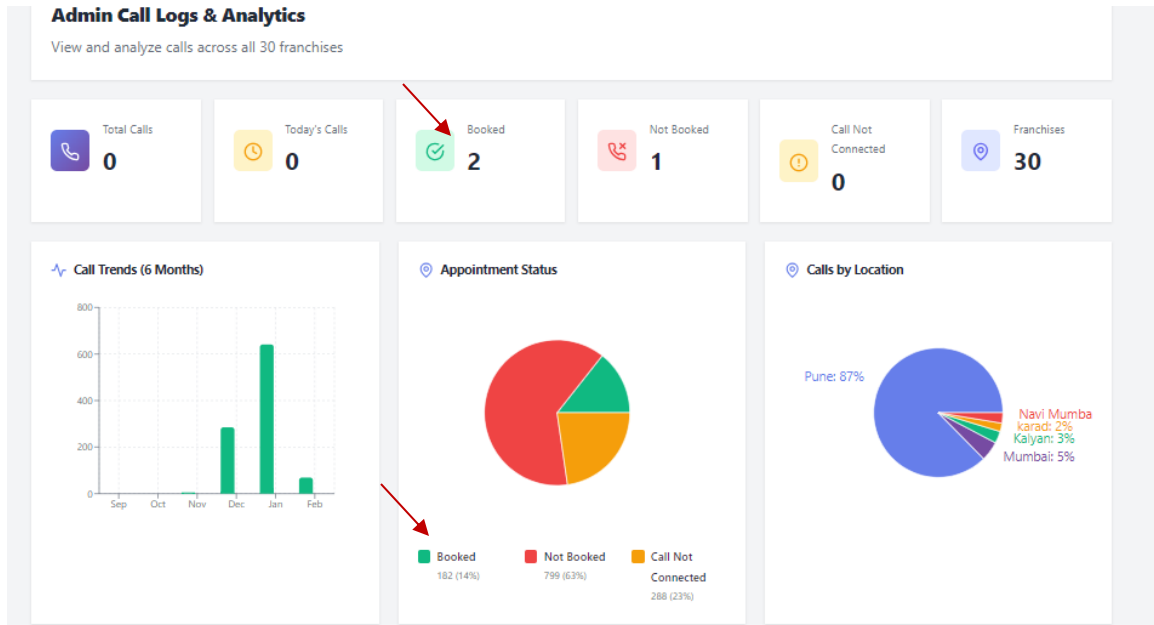

Components: KPI cards, analytics graphs, filter controls, search, timeline CTA, data table, pagination.

2. Major Strategic Findings

- KPI cards show hover effects but are non-clickable (false affordance, interaction inconsistency).
- No drill-down behavior from KPI metrics to filtered call logs.
- Filters apply only to table, not to graphs (data layer inconsistency).

- Analytics and operational logs are vertically stacked, causing excessive scroll.
- No synchronized interaction between graphs and data.

- Pagination visible only at bottom; record count visibility unclear.
- Strong backend data capability but limited insight-to-action flow.

3. Current Workflow (Observed)

Login → View KPI → Scroll → Apply Filter → Review Table → Scroll → Pagination

Issue: Metrics do not directly lead to actionable exploration.

4. Recommended Workflow (UX Optimized)

Login → Click KPI / Graph → Auto-filter → View Updated Analytics + Logs → Take Action

5. UX Maturity Evaluation

- Data Depth: Strong (multi-franchise tracking, trend graphs).
- Interaction Layer: Moderate (inconsistent drill-down patterns).
- Layout Efficiency: Needs structural segmentation.
- Enterprise Readiness: Moderate, requires export/reporting enhancement.

Estimated UX Score (Analytics Screen): 3.2 – 3.6 / 5
